

CLAIMS

integrated

Having thus described the invention, what is claimed is:

1. An expandable forming tool ^{for mounting in a punch press} having: ~~in the body~~

- (a) a body with a mounting stem on its upper surface and a transversely extending channel in its lower surface;
- (b) a wedge-shaped actuator having its smaller end slidably seated in said channel for movement vertically therein and having its larger end normally depending ^{and having an end surface for compacting upon the workpiece} from said body, said actuator having upwardly inwardly sloping side surfaces;
- (c) a pair of slide members slidably seated in said channel on opposite sides of said wedge-shaped actuator and having cooperating angular surfaces slidably bearing on said sloping side surfaces of said actuator;
- (d) slide member ^{spring} biasing means biasing said slide members against said sloping side surfaces of said actuator; and
- (e) actuator ^{spring} biasing means biasing said actuator outwardly of said body, said actuator being driven vertically inwardly of said channel by movement of said larger end against an opposing surface, ^{by action of the} said inward movement of said actuator pushing said slide members outwardly in said channel so as to project beyond the periphery of said body.
